AAG Launches Model Program to Support and Enhance Diversity

Where do we look to attract a more diverse group of students to our program? And what do we do once we find them?

These are common questions asked at the departmental level, the reproductive core of our discipline and the place where students enter and engage with universities through their majors. Despite growing national support for broadening participation in higher education, increasing university-level commitment to pursue goals of inclusion at their institutions, and widespread agreement with the goal of enhancing diversity within departments, undergraduate and graduate advisors can often find themselves at a loss for where and how to engage potential students from traditionally underrepresented populations. Answering questions which include the interrogative “where” are quite familiar to many geographers, although in too few instances have we collectively directed this valuable academic perspective to applications for recruitment and retention of underrepresented groups within departments. A rich set of knowledge and results from geographic research and information systems thus awaits application to the design of knowledge-based, place-specific, locationally-informed strategies to enhance diversity in geography programs, enabling departments to define appropriate collective visions of diversity and devise effective and feasible plans to reach recruitment and retention goals.

To support a process of collecting our disciplinary insight to improve diversity in geography, the AAG has proposed and received funding from the National Science Foundation’s Opportunities for Enhancing Diversity in the Geosciences Program for a $199,276 project “Addressing Locally-tailored Information Infrastructure & Geoscience Needs for Enhancing Diversity.” The ALIGNED project, a three-year pilot study, seeks to align the needs of university departments and underrepresented students by drawing upon the intellectual wealth of the discipline to inform and transform ways in which departments envision and realize their own goals to enhance diversity.

The pipeline principle—that is, building relationships among educational institutions serving students at different stages from grade school, middle school, secondary, community colleges, undergraduate to graduate levels—is fairly well understood as a framework for recruitment efforts in higher education. However, it is often overlooked how such pipelines are spatial in nature, and how characteristics of place impact recruitment outcomes and retention rates. Where universities are, where prospective students are coming from or might come from, and the dynamic of these origins and destinations matter a great deal. It is also important to recognize the varied starting points for many departments: a small liberal arts school in the rural Midwest will have different realities to contend with concerning recruitment and retention than an urban commuter school on the east coast.

With this in mind, the ALIGNED project will consolidate the set of resources and studies developed over the past five years by the AAG to design a toolkit that can support departments in their efforts to enhance diversity. This toolkit will include, among other items, linkages to an expanded AAG Diversity Clearinghouse (www.aag.org/diversity), an annotated bibliography highlighting cutting-edge research by geographers and related scholars that offer understanding about how spatial dynamics and place-based realities relate to efforts to attract and keep underrepresented students; careers information resources that promote broader inclusion; and outcomes from the AAG’s recent research on graduate education continued on page 4
conducted through the EDGE project. It will also feature a mechanism to query spatial data and georeferenced information that can help departments identify their recruitment catchment areas, design diversity goals in relation to characteristics of communities of potential underrepresented students, and elaborate appropriate plans for how to best engage prospective young geographers. ALIGNED will also expand the opportunities for underrepresented students in geography to participate in professional networking through organizing special activities at the AAG Annual Meeting and through providing supplemental support for attending the conference to students with disabilities, community college students, and AAG Diversity Ambassadors. It will also support more participation in the Visiting Geographical Scientist Program for faculty to visit Historically Black Colleges & Universities, Hispanic-Serving Institutions, and Tribal Colleges & Universities. To evaluate the toolkit design, the AAG will work closely with an institutionally-diverse, geographically-distributed set of seven pilot hybrid geography/geosciences departments and will reach out to synergistic programs in the social, behavioral and economic sciences. These opportunities will help to increase the diversity of researchers who participate in NSF programs in the social, behavioral and economic sciences. These opportunities will help to increase the participation of scientists from underrepresented groups in selected areas of science in the United States. More information is available at www.nsf.gov/funding. Full proposals are due October 19, 2009.

Minority Postdoctoral Research Opportunities

The Directorate for Social, Behavioral and Economic Sciences (SBE) at the National Science Foundation (NSF) is offering Minority Postdoctoral Research Fellowships and Research Starter Grants in an effort to increase the diversity of researchers who participate in NSF programs in the social, behavioral and economic sciences. These opportunities will help to increase the participation of traditionally underrepresented groups, including women, ethnic minority, gay, and foreign-born researchers in recognition of the value of multiple perspectives to help mobilize and retool departments with better ways to learn where to find and how to connect with underrepresented groups, including how to convey the relevance of geography and geoscience careers.

NSF reviewers called the effort “an innovative and potentially transformative project with substantial merit, a refreshingly creative approach to understanding how we might improve recruitment and retention of underrepresented students in the geoscience-related fields.” For more information about the ALIGNED project, including how to participate as a pilot department, please contact Patricia Solis (psolis@aag.org).
